

Job Recommendation and Candidate Matching Using Content-Based Filtering and Cosine Similarity

TEAM MEMBERS: _____

COLLEGE: _____

Slide 2 — Problem Statement

Finding suitable job opportunities from a large number of job postings can be difficult and time-consuming for candidates. Traditional job searching requires users to manually compare their skills with job requirements. This project aims to develop a recommendation approach that matches candidate skills with job descriptions and ranks jobs according to their similarity using Content-Based Filtering and Cosine Similarity.

Slide 3 — Objectives

- Recommend relevant jobs based on a candidate's profile.
- Match candidate skills with job requirements.
- Reduce the time and effort involved in manual job searching.
- Rank available jobs according to their similarity with the candidate profile.

Slide 4 — Dataset

Dataset	Job Skill Set
Records	1,167
Columns	5
Fields	job_id category job_title job_description job_skill_set

Add a small dataset screenshot here if required.

Slide 5 — Exploratory Data Analysis (EDA)

Insert your 3–4 best graphs in the spaces below.

Slide 6 — Methodology

Slide 7 — Results

Replace the placeholders below with your actual Top 10 output.

Rank	Job	Similarity
1	Your actual result	____.____%
2	Your actual result	____.____%
3	Your actual result	____.____%
4	Your actual result	____.____%
5	Your actual result	____.____%
6	Your actual result	____.____%
7	Your actual result	____.____%
8	Your actual result	____.____%
9	Your actual result	____.____%
10	Your actual result	____.____%

Slide 8 — Conclusion & Future Scope

Conclusion: The system demonstrates how Content-Based Filtering and Cosine Similarity can be used to identify jobs that are similar to a candidate's profile.

Future Scope: Resume upload, improved NLP models, location matching, experience matching, and a complete web interface.

Optional: Add one small architecture/result image or key performance metric.
